Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Effantin G,

Treatment of crops, useful for controlling fungi on, e.g. cereals, potato, cotton or rape, comprises applying inhibitor of acetohydroxy acid isomeroreductase. WPI; 2003-405775/39.

Claim 2; Fig 1; 66pp; French.

The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention

                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                       240
                                                                                                                               The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention

candidate for an antibiotic comprising or cure. Compount as a candidate for an antibiotic comprising contacting or cure carbamoytransferase (OCTase) or ketol-acid reductoisomerase polypeptide, or fungal pathoganicity-conferring gane with a test compound. The method comprises: contacting OCTase polypeptide, ketol-acid reductoisomerase polypeptide, or fungal pathoganicity-conferring gene with a test compound or and detecting the presence or absence of binding between the test compound and the polypeptide or absence of binding indicates that the test compound and the polypeptide or an antibiotic. Also described are: an isolated nucleic acid comprising a nucleotide sequence encoding a polypeptide having at least 50% sequence identity to, or having or 10% of the activity of, 400, 403 or 469 amino acids; and an isolated or 469 amino acids. The methods are useful for identifying inhibitors of crithine carbamoytransferase, ketol-acid reductoisomerase, and fungal pathoganicity-conferring gene as antibiotics. This is the amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     301 EATQSLYPLIGAHGMDWMFDACSTTARRGAIDWTPKFKDALKPVFNNLYDSVKNGDERKR 360
                                                                                                                                                                                                           The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           241 GVAVGSGYLYETTFEKEVYSDLYGERGCLMGGIHGMFLAQYEVLRERGHSPSEAFNETVE 300

                                                                                                                              The invention describes a method of identifying a test compound as a candidate for an antibiotic comprising contacting contithine candidate for an antibiotic comprising contacting contithine carbamoytransferase (OcTase) or Ketol-acid reductoisomerase polypeptide, or fungal pathogenicity-conferring gene with a test compound. The method comprises: contacting OcTase polypeptide, ketol-acid reductoisomerase polypeptide, or fungal pathogenicity-conferring gene with a test compound; and detecting the presence or absence of binding between the test compound and the polypeptide or gene, where binding indicates that the cest compound is a candidate for an antibiotic. Also described are: an isolated nucleic acid comprising a nucleotide sequence encoding a polypeptide having at least 50% sequence identity to, or having at least 10% of the activity of, 400, 403 or 469 amino acids and an isolated polypeptide consisting essentially of the amino acid sequence of 400, or 469 amino acids and inibitors of or 469 amino acids carbamoytransferase, ketol-acid reductoisomerase, and fungal pathogenicity-conferring gene as antibiotics. This is the amino acid captoconferring gene as antibiotics. This is the amino acid sequence of Mycosphaerella graminicola ketol-acid reductoisomerase KARI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             57 FAGHKEQVWERADWPKEKLLEYPKDDTLALIGYGSQGHGQGLNLRDNGLNVIIGVRKDGK 116

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat a non-infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a chergensing recombinant protein for characterisation, screening or expressing recombinant protein for characterisation, screening or characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologus essential or virulence genes for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identify inhibitors of the binding occurs or to identify inhibitors of the binding cure or to identify inhibitors of the binding certer or response, as a reagent in assays designed to quantitatively determine levels of the protein or organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence for factors. This sequence represents a protein of one of the essential genes or of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fungicide; cytostatic; essential gene; Aspergillus fumigatus; infection; cancer; contamination; biofilm; antibody; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SM:

the invention are used to treat our prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar blochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune
                                                                                                                                                                                                                                                                                                          response, and for identifying polynucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or expressing recombinant protein for characterisation, screening or expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic crganisms invade or resaide, for comparing with the DNA sequences of A. (uniquatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns. for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit annother immune response, and for identifying polyuncleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for lost issues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represente a protein of one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      purified or isolated nucleic acids of

Lemieux SM

Hu W,

Eroshkin AM,

New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer. WPI; 2003-093124/08.

Disclosure; Page; 175pp; English.

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus or the polymucleotides are useful for expressing recombinant protein for characterisation, screening or corganisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA captures of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination or expression patterns, for raising anti-DNA antibodies or to elicit another immune corganisms, and for identifying polymucleotides encoding the other protein

```
with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention
                                                                                                                                                                                                           59 GHKEQVWERADWPKEKLLEYFKDDTLALIGYGSQGHGQGLNLRDNGLNVIIGVRKDGKSW 118

strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified essential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspezgillus funigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    179

```
Treatment of crops, useful for controlling fungi on, e.g. cereals, potato, cotton or rape, comprises applying inhibitor of acetohydroxy acid isomeroreductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertions or promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that is sesential to the survival or growth of a fungus to an antifungal contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian capant, an antifungal agent that inhibits the growth of a diploid fungus of activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosyntheric, transporter, transcriptional, compound catabolism, blosyntheric, transporter, transcriptional, compound catabolism, blosyntheric, transporter, transcriptional, compound studied is useful for identifying a compound having the ability to inhibit growth or proliferation of c. albicans cells and cesential candida albicans protein useful in the method of the invention. The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The second protein or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active agent of apharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition of for developing a disease or disorder in a subject. These are also useful in acreening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein complexes are useful for the manufacture of a medicament of complexes are protein and activity or protein the complexes are protein and activity or protein complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New proteins and protein complexes from eukaryotes, useful as targets in drug screening, or in diagnosing or screening for the presence of a disease or disorder, or a predisposition for developing a disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for the treatment or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was obtained from the EPO in electronic format).
                                                                                                      G, Kuester B, Schultz J;

A polymuclectide of the invention has fungicide activity, and may have a use in gene therapy. The nucleic acid is useful for preparing a composition for treating an infection caused by Cryptococcus neoformans. The present sequence represents a C. neoformans sequence of the invention. Note: The sequence data for this patent is not represented in

the 613 antisense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of the nucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleac acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibitied by the compound that incluences the activity of a gene in an operon required for the activity of a gene in an operon required for the proliferation or the activity of a gene in an operon required for computed for the strain antibitis cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the compound discovery programs, or for screening homologous nucleic acids are useful for identifying proteins or acreening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target profartoric essential genes modeled acids acids are this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1;

NetCol-acid reductoisomerase (EC 1.1.1.86) ILVS - yeast (Saccharomyces cerevisiae)
NyAlternate names acetohydroxyacid reductoisomerase ILVS; protein L9638.7; protein VLR3
C;Species: Saccharomyces cerevisiae
C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 05-Oct-2004
C;Accession: A24709; S51463
Nucleic Acids Res. 14, 9631-9651, 1986
A;Title: The ILVS gene of Saccharomyces cerevisiae is highly expressed.
A;Accession: A24709
A;Accession: A24709
A;Accession: A24709
A;Molecule type: DNA
